

Exploratory testing of the live sushi-go.com.ua website to quickly identify functional, UI/UX, and validation issues. 9 bugs were found and documented with severity and explanations.

№	Issue	Severity	Explanation
1	Facebook button in the footer redirects to the site itself (dr.sushi-go.com.ua/#1) instead of the real Facebook page.	medium	Broken external link; user expects to be redirected to Facebook profile.
2	Callback form accepts phone numbers with invalid operator codes.	high	No validation; users can submit incorrect or non-existing numbers.
3	Adding items to the cart requires an extra step — after clicking “Вибрати” a popup appears with only one button “Купити”, which just repeats the same action.	medium	Confusing and redundant UX flow: users have to perform two similar actions instead of one. The popup has no extra function (e. g., quantity selection).
4	Phone number field (login) clears automatically if the number is incomplete.	medium	Annoying input behavior; can cause login failure.
5	Cart content changes when switching between cities.	medium	The cart is tied to the selected city. Probably intentional (different branches), but from a UX point of view, it's confusing — if a user accidentally switches the city, all items disappear.
6	SMS confirmation (both login and checkout) accepts any number, even invalid ones like 380000000000	high	No backend validation; system accepts fake numbers and still sends SMS, which can cause resource waste or misuse.
7	One “grey pizza” item in the product list has no image; when trying to add it to the cart, an invisible or broken popup appears.	medium	Incorrect product card; missing image and broken modal window prevent adding the item and make the site look buggy.
8	Footer description differs by city.	low	Inconsistent layout and information; weakens brand trust.
9	“Public Offer Agreement” page — title repeats 3 times and text encoding differs between browsers.	medium	HTML/encoding issue; poor text display on different browsers.
